

# CONTRACT GOVERNANCE INTELLIGENCE SUITE

A Power BI project built at the intersection of legal reasoning and data analytics

Most organisations manage contracts reactively. Obligations are tracked in spreadsheets. Coverage gaps are discovered during audits. Clause deviations accumulate unnoticed. Renewal deadlines pass without action.

**This dashboard was built to change that. Four pages. One data model. Complete contract governance visibility across a multi-jurisdiction portfolio.**

## PORTFOLIO AT A GLANCE

**194**

Obligations tracked

**83.0%**

Compliance rate

**51.7%**

Coverage rate

**180**

Deviations logged

**43.6%**

Pipeline health

## WHAT THE DASHBOARD ANSWERS

### 01 OBLIGATION TRACKER

Which obligations are overdue, who owns them, and what are the patterns?

**24 overdue | 9 at risk | 83% compliance**

### 02 COVERAGE MAP

Do we have signed agreements everywhere we should?

**11 critical gaps | 0% coverage in Spain**

### 03 DEVIATION REGISTER

Which clauses are being changed most, and are deviations being approved?

**20 high-risk pending | 46.7 days avg resolution**

### 04 RENEWAL PIPELINE

What expires when, and are we ahead of it?

**EUR 46M at risk | 12 notice deadlines missed**

## BUILT WITH

**Power BI** Star schema data model | 60+ DAX measures | Weighted risk scores | Time intelligence | Conditional formatting | Custom theme

**Python** Dataset generation with pandas | Realistic multi-jurisdiction mock data | 11 tables, 700+ rows

**Domain** Contract law | Contract compliance | Regulatory intelligence | Facilities management operations

## WHY THIS DASHBOARD MATTERS

The problem most legal and commercial teams face is not lack of data. It is lack of structure.

### KEY INSIGHTS FROM THE DATA

- 01 Spain has zero supplier coverage. No signed agreements exist for any supplier-client pair in the country. This is not a data quality issue, it is a governance failure that creates direct legal and commercial risk for every operational relationship in that jurisdiction.
- 02 EUR 46 million in contract value sits in agreements that have already passed their notice deadline without a formal renewal decision. These organisations are no longer in control of their exit or renegotiation options.
- 03 47% of all tracked obligations carry an escalation flag. In a well-governed portfolio, escalation should be an exception. At nearly half of all obligations, it has become the norm, which means the process, not just the outcomes, needs to change.
- 04 Payment Terms and Liability Cap are the two most frequently deviated clauses, and both show high rates of recurring deviations. When the same counterparties push back on the same clauses repeatedly, the standard template is the problem.
- 05 The deviation approval process averages 46.7 days. For a process that directly gates contract execution and risk exposure, this timeline creates uncertainty that compounds across every active negotiation in the portfolio.

### THE VALUE OF A GOVERNANCE DASHBOARD

#### From reactive to proactive

Contract teams stop discovering problems during audits and start seeing them as they develop. Every overdue obligation, every coverage gap, every missed deadline is visible before it becomes a crisis.

#### Accountability without effort

Every obligation, deviation, and renewal decision carries an owner. The dashboard surfaces accountability automatically, without requiring manual status chasing or weekly update meetings.

#### Legal and data in one view

The dashboard was designed by someone who reads contracts and builds models. Most analysts do not read regulation. Most lawyers do not build dashboards. The combination is rare, and it shows in the output.

### ABOUT THIS PROJECT

The Contract Governance Intelligence Suite is a personal portfolio project built to demonstrate what happens when legal reasoning and analytical capability work together. The dataset is synthetic but realistic, modelled on a multi-jurisdiction European facilities management portfolio with 10 clients, 15 suppliers, and 50 contracts across 10 countries.

The data model uses a star schema architecture with four fact tables and seven dimension tables. All 60+ DAX measures were written from scratch, including weighted composite scores for obligation risk, coverage health, and pipeline health. The report is backed by a full analytical document covering findings and recommended actions across all four modules.
